

STARBUCKS GLOBAL STORE ANALYSIS

Prepared By : Shashank

Data Analytics & Business Intelligence Project Report

1. Executive Summary

This project analyzes Starbucks' global store network using data analytics, SQL, Python, and Power BI. The objective was to gain insights into store distribution, ownership models, and geographic expansion opportunities. The dataset consists of approximately 25,600 Starbucks stores spread across 74 countries and nearly 5,000 cities. Using business intelligence techniques, interactive dashboards were created to help stakeholders understand market concentration, ownership structure, and strategic growth opportunities.

2. Business Problem Statement

Starbucks operates one of the largest coffeehouse chains in the world. Managing thousands of stores across multiple countries requires continuous monitoring of geographic presence and ownership structure. The key challenge was to identify where Starbucks is strongest, which markets are growing rapidly, and where future expansion could be considered. This project answers critical business questions related to country-wise store distribution, city concentration, and ownership patterns.

3. Dataset Overview

The dataset contains detailed information about Starbucks stores globally. Important attributes include Country, City, State/Province, Ownership Type, Latitude, Longitude, Store Name, and Store Number. The dataset covers a wide geographical area and provides enough information to perform regional analysis and market segmentation.

4. Data Cleaning and Preparation

Before analysis, data quality checks were performed. Missing values were identified and reviewed, duplicate records were removed, and irrelevant columns were excluded. Python libraries such as Pandas and NumPy were used to prepare the dataset. The cleaned data ensured accurate calculations and reliable business insights. This phase is critical because poor data quality can significantly affect dashboard accuracy and decision-making.

5. Exploratory Data Analysis

Exploratory Data Analysis (EDA) was conducted to identify trends and patterns. Country-level analysis showed that the United States dominates Starbucks' global presence. China emerged as the strongest international market. City-level analysis revealed that metropolitan cities such as Shanghai, Seoul, Beijing, New York, and London have the highest concentration of stores. EDA also highlighted geographic clustering across North America, Europe, and Asia.

6. Ownership Analysis

Starbucks uses multiple ownership models including Company-Owned, Licensed, Joint Venture, and Franchise stores. The analysis showed that Company-Owned stores account for the largest share of the global network. Licensed stores also represent a significant portion, particularly in international markets. Joint Ventures help Starbucks enter strategic regions through partnerships while Franchise stores form the smallest ownership category.

7. Dashboard Insights and Strategic Recommendations

The dashboards reveal that Starbucks has a highly concentrated presence in a few major countries.

Expansion opportunities exist in underrepresented regions where market penetration remains low. The company can leverage licensed and joint venture models to reduce risk while entering new markets. Geographic intelligence can further support site-selection decisions and regional expansion strategies. Data-driven decision making enables Starbucks to allocate resources more effectively and maximize future growth.

Dashboard 1: Global Store Analysis Dashboard

This dashboard provides visual insights into Starbucks store distribution, ownership patterns, and geographic presence. Interactive visuals allow users to identify trends and compare performance across countries and cities.

Dashboard 2: Geographic Intelligence Dashboard

This dashboard provides visual insights into Starbucks store distribution, ownership patterns, and geographic presence. Interactive visuals allow users to identify trends and compare performance across countries and cities.

Dashboard 3: Strategic Insights Dashboard

This dashboard provides visual insights into Starbucks store distribution, ownership patterns, and geographic presence. Interactive visuals allow users to identify trends and compare performance across countries and cities.

8. Conclusion

This project demonstrates the practical application of Data Analytics, SQL, Python, and Power BI in solving real-world business problems. The analysis revealed that Starbucks' global operations are highly concentrated in key markets such as the United States and China. Ownership analysis showed that company-owned and licensed stores are the dominant business models. The dashboards developed during this project provide an intuitive platform for decision-makers to evaluate performance and identify opportunities. Future enhancements could include revenue analysis, customer segmentation, predictive analytics, and machine learning models for expansion forecasting.
